

R + LATEX

A Very Brief Introduction

Yannick Dufresne, Ph.D.
Department of Political Science

Objectives & Philosophy

Objectives & Philosophy

- ▶ Installation: RStudio + \mathbb{R} + L^AT_EX

Objectives & Philosophy

- ▶ Installation: RStudio + \mathbb{R} + \LaTeX
- ▶ Overview: \mathbb{R} and \LaTeX
 1. The World of Open Source
 2. Some Bases of \mathbb{R} Programming
 3. Making graphs in \mathbb{R} and using \LaTeX

Objectives & Philosophy

- ▶ Installation: RStudio + \mathbb{R} + \LaTeX
- ▶ Overview: \mathbb{R} and \LaTeX
 1. The World of Open Source
 2. Some Bases of \mathbb{R} Programming
 3. Making graphs in \mathbb{R} and using \LaTeX
- ▶ Philosophy: Tools *before* methods

Installation

2 Languages, 1 Software

Installation

2 Languages, 1 Software

1. R : www.cran.rstudio.com

Installation

2 Languages, 1 Software

1. R : www.cran.rstudio.com
2. L^AT_EX: www.latex-project.org/get/

Installation

2 Languages, 1 Software

1. R : www.cran.rstudio.com
2. L^AT_EX: www.latex-project.org/get/
3. RStudio: www.rstudio.com/products/rstudio/download/

Installation

2 Languages, 1 Software

The screenshot shows the RStudio interface with the following details:

- Project:** (None)
- Code Editor:** An R script titled "CreateMaps.R" containing the following code:

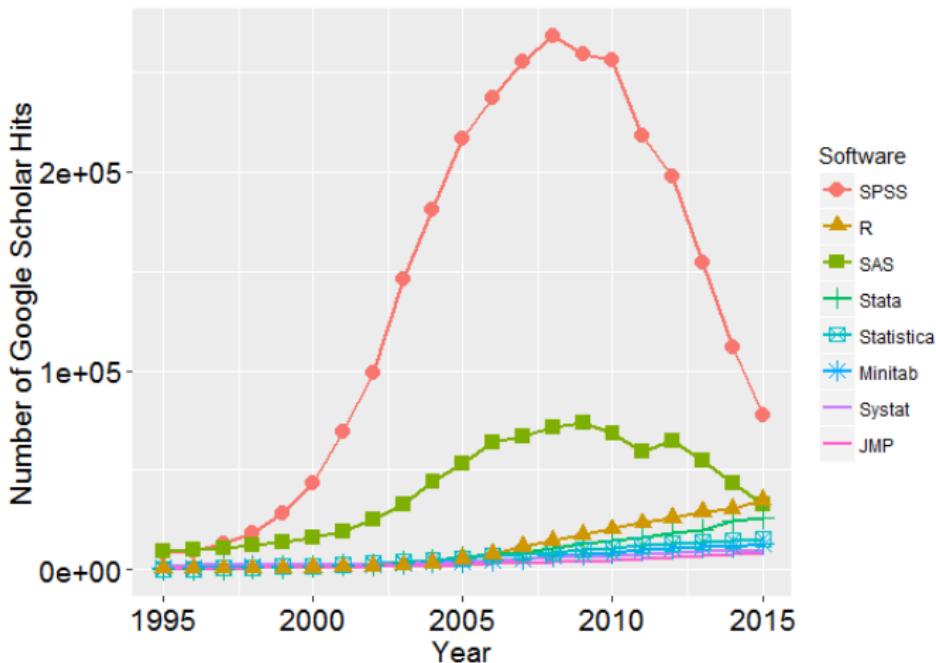

```
63 ##### MAP THE ADDITIVE SCALE
64 library(RColorBrewer)
65 library(mapprojtools)
66 library(ggplot2)
67 library(rworldmap)
68
69
70 # Replace Badly coded countries in df
71 Data$region[Data$region == "Russian Federation"] <- "Russia"
72 Data$region[Data$region == "United Kingdom"] <- "UK"
73 Data$region[Data$region == "Congo"] <- "Republic of Congo"
74 Data$region[Data$region == "DR Congo"] <- "Democratic Republic of the Congo"
75
76 #
77 mapWorld = map_data(map='world')
78 mapWorld = merge(Data, mapWorld, by='region', all.y=TRUE)
79 mapWorld = mapWorld[order(mapWorld$order), ] # <---
80
81 # Fix missing code in World
82 mapWorld$region[mapWorld$region == "Denmark"] <- "Greenland"
83
```
- Environment:** Shows "Environment is empty".
- Files:** Shows tabs for "Files", "Plots", "Packages", "Help", and "Viewer".
- Console:** Displays the command line history:

```
>
>
>
>
>
>
>
>
> 1+1
[1] 2
> |
```

The World of Open Source

Why R ?

Why R ?

Why R? Reasons to Love

1. Free
2. Available for all OS
3. Graphs + \LaTeX
4. Popularity + Packages
5. *Open source*: Developed by and for academics

Why R ? Reasons to Hate

1. Programming code = Steep learning curve
2. Eclectic development. At times, chaotic

Why L^AT_EX?

Why L^AT_EX? Reasons to Love

- ▶ Bibliography: BibT_EX
- ▶ Table of content, tables, etc.
- ▶ Deals automatically with stuff like tables, figures, etc.
- ▶ Pretty templates
- ▶ Code + *Open source* = A large expert community on the web

Why L^AT_EX? Reasons to Hate

- ▶ Tough to learn... I mean very tough. But the basics are easy
- ▶ Incompatible with MS Word
- ▶ ~~No spell checker~~
- ▶ No “Change trackers” and stuff like that
- ▶ Final document available only after code compilation
- ▶ Some journals do not accept L^AT_EX submission... others strongly encourage it

L^AT_EX: A Nice Table

Table 1. Length of Bananas and Apples

Quantile	Bananas	Apples
0%	59	44
50%	69	64
100%	77	71

LATEX: The Nice Table Code

```
\begin{table}
  \centering
  \caption{Length of Bananas and Apples}
  \begin{tabular}{lrr}
    Quantile & Bananas & Apples\\ \hline
    0\%      & 59      & 44 \\
    50\%     & 69      & 64 \\
    100\%    & 77      & 71 \\
  \end{tabular}
  \label{tab:bananasapples}
\end{table}
```

L^AT_EX: It's a joke, right?!

LATEX: Nope

LATEX

R Programming Bases

R = Programming Language

- ▶ Calculation operators
- ▶ Assignment operators
- ▶ Logical operators
- ▶ Control instructions

Calculation Operators

- ▶ +
- ▶ -
- ▶ /
- ▶ %%

Logical Operators

- ▶ `==`
- ▶ `!=`
- ▶ `>=`
- ▶ `<=`
- ▶ `<`
- ▶ `>`
- ▶ `&`
- ▶ `|`
- ▶ `%in%`

Control Instructions

- ▶ if... else
- ▶ for loop

R Data Structure

Data Structure

- ▶ Constants

Data Structure

- ▶ Constants
- ▶ Vectors

Data Structure

- ▶ Constants
- ▶ Vectors
- ▶ Data frames

Constants

<...>

```
1 variableString <- "Banana"
2 variableNumerical <- 1492
3 variableBoolean <- TRUE
```

Vecteurs

```
1 vecteurString <- c(variableString, "Apple", "Orange", "Sand Paper")
2 vecteurNumerical <- c(variableNumerical, 1604, 2011, 0328424)
3 vecteurBoolean <- c(variableBoolean, FALSE, TRUE, TRUE)
```

Data Frames

<...>

```
1 Data <- data.frame(vectorString, vectorNumerical, vectorBoolean, c(23,17,32,56))
```

Functions

R Base Functions

- ▶ `length()`
- ▶ `min()`
- ▶ `max()`
- ▶ `sum()`
- ▶ `median()`
- ▶ `mean()`

R Function: mean()

<...>

```
1 mean(yourVector)
```

Creating a Function in R

R Function: meanGirls()

R Function: meanGirls()

<...>

```
1 meanGirls <- function(Data){  
2     result <- sum(Data$age[Data$woman==1])/length(Data$age[Data$woman==1])  
3     return(result)  
4 }
```

R Function: meanGirlsPlus()

<...>

```
1 meanGirlsPlus <- function(Data, star=FALSE){  
2     if(star == FALSE){  
3         result <- sum(Data$age[Data$woman==1])/length(Data$age[Data$woman==1])  
4     } else {  
5         result <- sum(Data$age[Data$woman==1])/length(Data$age[Data$woman==1])  
6         result <- paste("*****", result, "*****")  
7     }  
8     return(result)  
9 }
```

Then?

Then? More R Functions...

```
meanGirls()  
meanGirlsPlus()  
meanBoys()  
meanBoysPlus()
```

Then? A \mathbb{R} Package

MeanSexPak

```
meanGirls()  
meanGirlsPlus()  
meanBoys()  
meanBoysPlus()
```

Then? Package Publication

MeanSexPak

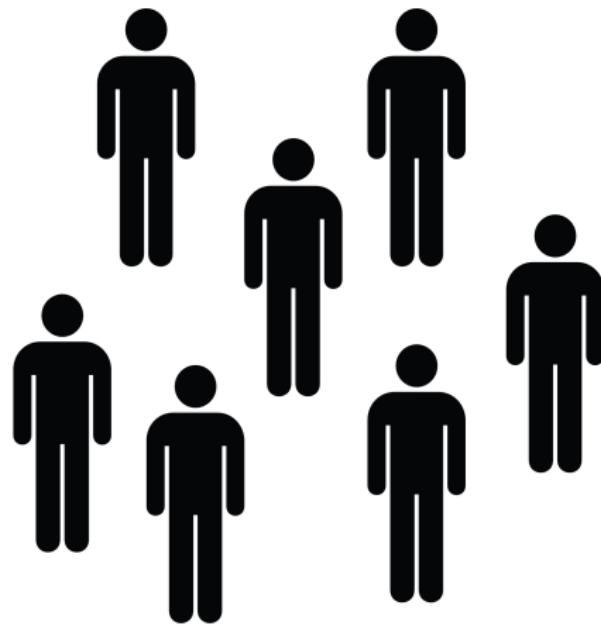

```
meanGirls()  
meanGirlsPlus()  
meanBoys()  
meanBoysPlus()
```

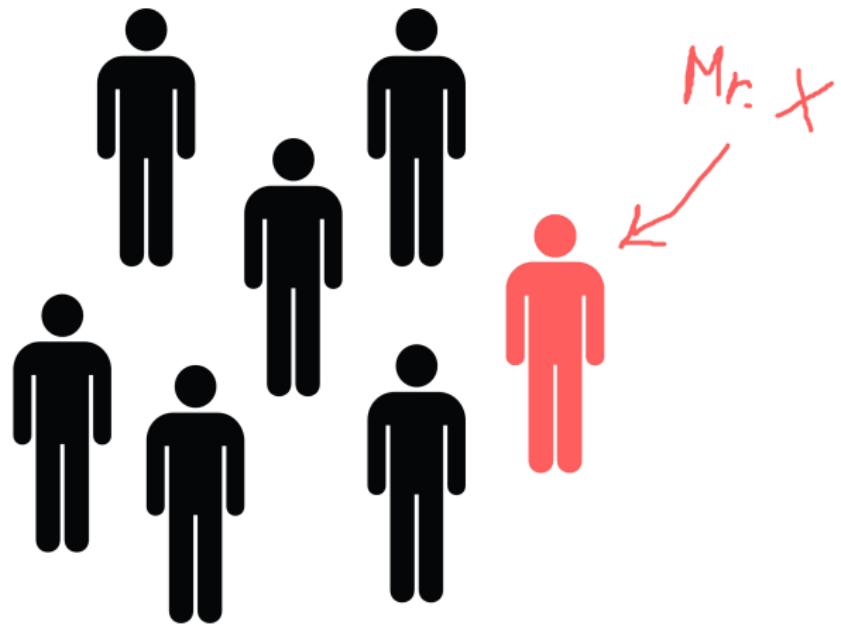

Then? Diffusion to the Community

R Community

Mr. X

Then? Mr. X Installs the Package

<...>

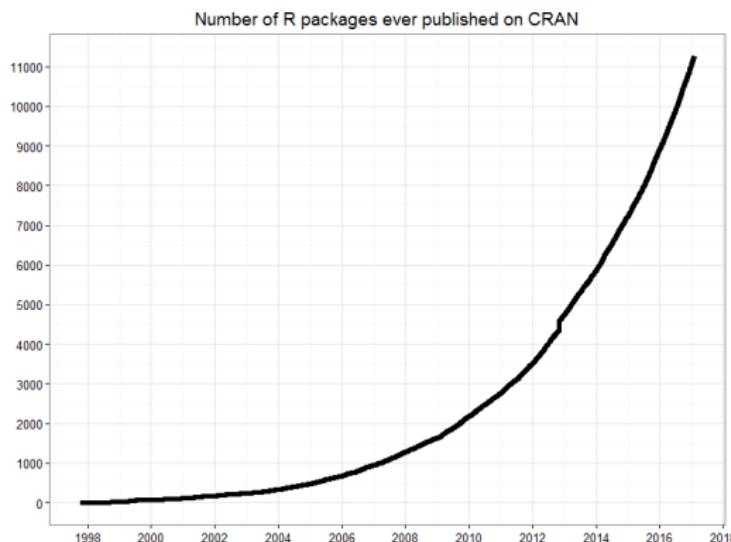

```
1 |install.packages("MeanSexPak")
```

Ensuite? Mr. X Uses the Package

<...>

```
1 library(MeanSexPak)
2
3 # Calculate the mean age of the girls
4 girlsMeanAge <- meanGirls(MrXOwnData)
```

Number of R Packages

**Enough blabla...
Let's Code!**
